How forecasts are made

Most of the annual streamflow in the western United States originates as snowfall that has accumulated in the mountains during the winter and early spring. As the snowpack accumulates, hydrologists estimate the runoff that will occur when it melts. Measurements of snow water equivalent at selected manual snow courses and automated SNOTEL sites, along with precipitation and streamflow values are used in computerized statistical and simulation models to prepare runoff forecasts. These forecasts are coordinated between hydrologists in the Natural Resources Conservation Service and the National Weather Service. Unless otherwise specified, all forecasts are for flows that would occur naturally without any upstream influences.

Forecasts of any kind, of course, are not perfect. Streamflow forecast uncertainty arises from three primary sources: (1) uncertain knowledge of future weather conditions, (2) uncertainty in the forecasting procedure, and (3) errors in the data. The forecast, therefore, must be interpreted not as a single value but rather as a range of values with specific probabilities of occurrence. The middle of the range is expressed by the 50% exceedance probability forecast, for which there is a 50% chance that the actual flow will be above, and a 50% chance that the actual flow will be below, this value. To describe the expected range around this 50% value, four other forecasts are provided, two smaller values (90% and 70% exceedance probability) and two larger values (30%, and 10% exceedance probability). For example, there is a 90% chance that the actual flow will be more than the 90% exceedance probability forecast. The others can be interpreted similarly.

The wider the spread among these values, the more uncertain the forecast. As the season progresses, forecasts become more accurate, primarily because a greater portion of the future weather conditions become known; this is reflected by a narrowing of the range around the 50% exceedance probability forecast. Users should take this uncertainty into consideration when making operational decisions by selecting forecasts corresponding to the level of risk they are willing to assume about the amount of water to be expected. If users anticipate receiving a lesser supply of water, or if they wish to increase their chances of having an adequate supply of water for their operations, they may want to base their decisions on the 90% or 70% exceedance probability forecasts, or something in between. On the other hand, if users are concerned about receiving too much water (for example, threat of flooding), they may want to base their decisions on the 30% or 10% exceedance probability forecasts, or something in between. Regardless of the forecast value users choose for operations, they should be prepared to deal with either more or less water. (Users should remember that even if the 90% exceedance probability forecast is used, there is still a 10% chance of receiving less than this amount.) By using the exceedance probability information, users can easily determine the chances of receiving more or less water.

The United States Department of Agriculture (USDA) prohibits discrimination in its programs on the basis of race, color, national origin, sex, religion, age, disability, political beliefs and marital or familial status. (Not all prohibited bases apply to all programs.) Persons with disabilities who require alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at 202-720-2600 (voice and TDD).

To file a complaint, write the Secretary of Agriculture, U.S. Department of Agriculture, Washington, D.C., 20250, or call 1-800-245-6340 (voice) or (202) 720-1127 (TDD). USDA is an equal employment opportunity employer.

- Ideas on water, land, and crop management for you to consider while creating your drought plan.

Arizona Agri-Weekly

<http://www.nass.usda.gov/az/cur-agwk.pdf>

- Provides an overview of Arizona’s crop, livestock, range and pasture conditions as reported by local staffs of the USDA’s Agricultural Statistic Service and the University of Arizona, College of Agriculture.

SUMMARY

Snow surveys conducted at the end of February show snowpack levels are well below average for this time of year. As a result, the long range forecast calls for well below normal streamflow levels during the late winter and early spring runoff season.

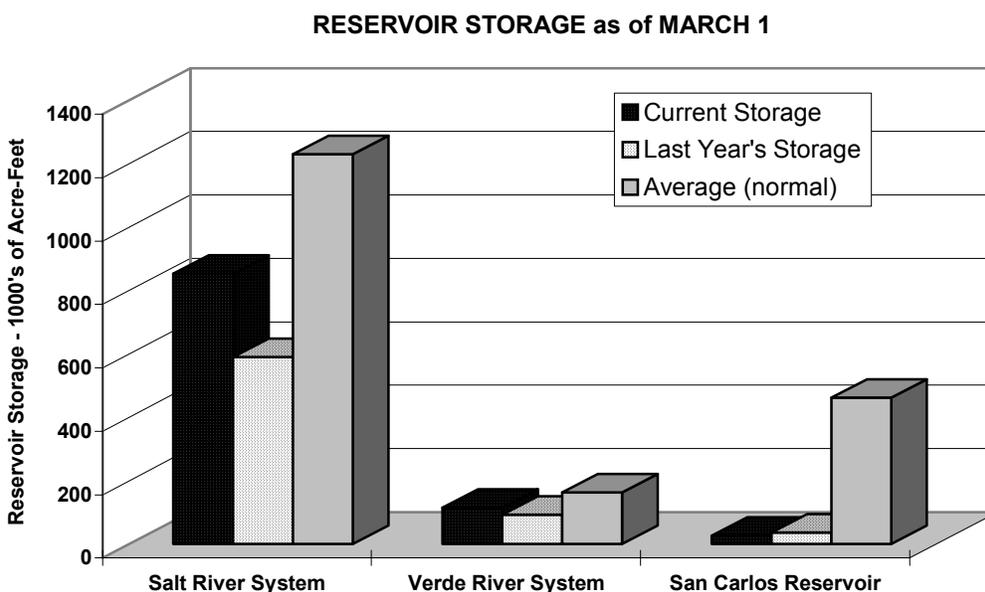

SNOWPACK

| Watershed | Percent (%) of 30-Yr. Average Snowpack Levels as of March 1 |
|--------------------------------------|---|
| Salt River Basin | 73% |
| Verde River Basin | 76% |
| Little Colorado River Basin | 62% |
| San Francisco-Upper Gila River Basin | 65% |
| Other Points of Interest | |
| Chuska Mountains | 83% |
| Central Mogollon Rim | 68% |
| Grand Canyon | 70% |
| San Francisco Peaks | 81% |
| Statewide Snowpack | 73% |

PRECIPITATION

February data shows much above average precipitation catch at key stations in northwestern Arizona, however, the Oct-February seasonal cumulative catch remains well below normal for the region. Additionally, NRCS SNOTEL stations in the Verde basin recorded abundant moisture for the month of February. For more information on precipitation levels, please refer to the basin bar graphs found in this report.

RESERVOIR

Key storage volumes displayed in thousands of acre-feet (1000 x):

| RESERVOIR | CURRENT STORAGE | LAST YEAR STORAGE | 30-YEAR AVERAGE |
|----------------------|-----------------|-------------------|-----------------|
| Lyman Lake | 2.3 | 2.3 | 15.4 |
| Show Low Lake | 2.1 | 2.1 | 3.7 |
| Lake Pleasant | 659.7 | 582.7 | ---- |
| Lake Havasu | 572.9 | 572.9 | 552.4 |
| Lake Mohave | 1728.5 | 1728.5 | 1675.1 |
| Lake Mead | 16978.0 | 16978.0 | 22122.0 |
| Lake Powell | 12844.0 | 12844.0 | 18236.0 |
| Salt River System | 590.1 | 590.1 | 1231.5 |
| Verde River System | 115.7 | 92.6 | 163.5 |
| San Carlos Reservoir | 27.2 | 37.6 | 461.4 |

STREAMFLOW

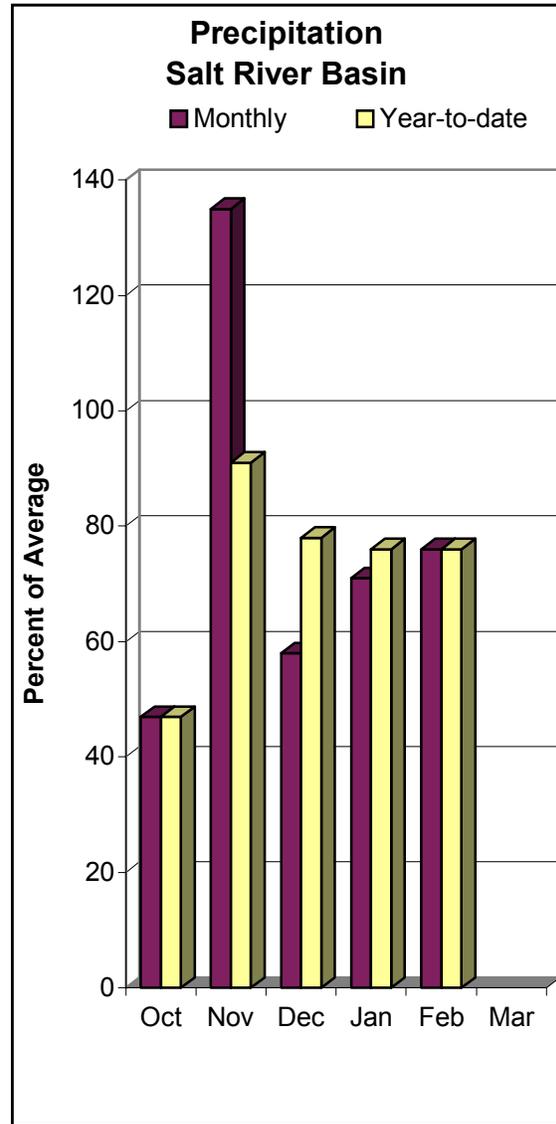

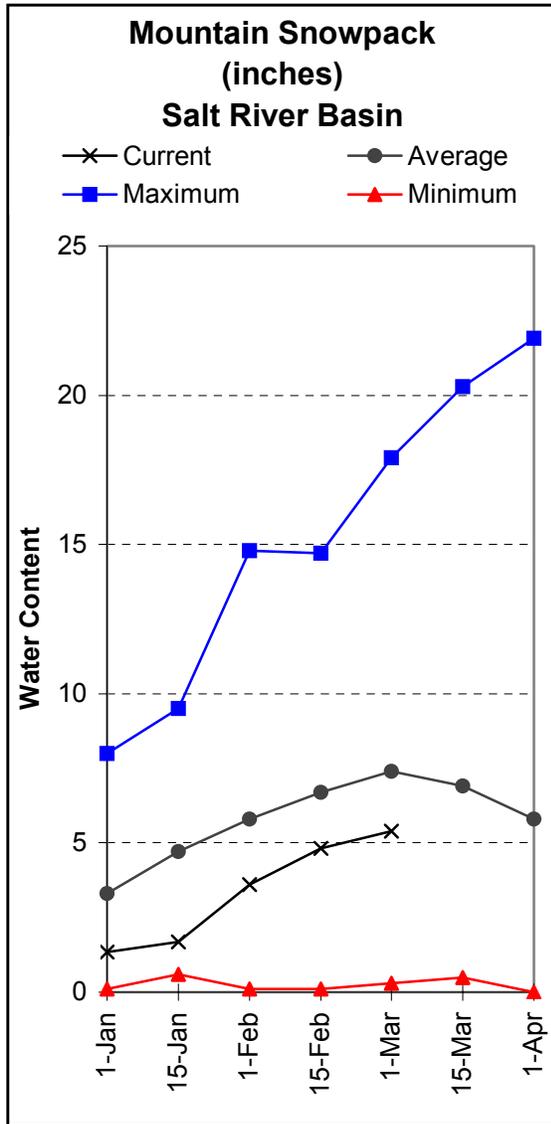

Below median streamflow levels are forecast for key watersheds in Arizona. Please refer to the forecast tables found in this report for more information regarding seasonal runoff forecasts.

SALT RIVER BASIN as of March 1, 2004

Below median streamflow levels are forecast for the basin. In the Salt River, near Roosevelt, the forecast calls for 39 % of median streamflow levels through MAY, while at Tonto Creek, the forecast calls for 23 % of median streamflow levels through MAY.

Snow survey measurements show the Salt snowpack to be 73 % of the 30-year average, while combined reservoir storage for the Salt River system stands at 853,763 acre-feet.

SALT RIVER BASIN
Streamflow Forecasts - March 1, 2004

| Forecast Pt Forecast Period | <=== Drier === Future Conditions === Wetter ===> | | | | | | 30 Yr Med (1000AF) |
|---------------------------------------|--|-----------------|--------------------------------------|-----------------|-----------------|-----|-----------------------|
| | Chance of Exceeding * | | | | | | |
| | 90% (1000AF) | 70% (1000AF) | 50% (Most Prob) (1000AF) (% MED.) | 30% (1000AF) | 10% (1000AF) | | |
| Salt River nr Roosevelt | | | | | | | |
| MAR-MAY | 39 | 73 | 105 | 39 | 145 | 219 | 270 |

| Tonto Creek ab Gun Creek nr Roosevelt | | | | | | | |
| MAR-MAY | | | | | 0.2 | 2.3 | 6.0 |
| 23 | 12.2 | 28 | 26 | | | | |
| MARCH | 0.5 | 1.7 | 3.0 | 18 | 10.2 | 21 | 16.9 |

* 90%, 70%, 30%, and 10% chances of exceeding are the probabilities that the actual volume will exceed the volumes in the table.

The average and median are computed for the 1971-2000 base period.

- (1) - The values listed under the 10% and 90% Chance of Exceeding are actually 5% and 95% exceedance levels.
- (2) - The value is natural volume - actual volume may be affected by upstream water management.

SALT RIVER BASIN

SAN FRANCISCO - UPPER GILA RIVER BASIN as of March 1, 2004

Below median streamflow levels are forecast for the basin. In the San Francisco River, at Clifton, the forecast calls for 37 % of median streamflow levels through MAY, while in the Gila River, near Solomon, the forecast calls for 24 % of median streamflow levels through MAY. At San Carlos Reservoir, inflow into the lake is forecast at 16 % of median through MAY.

At San Carlos, reservoir storage stands at 27,180 acre-feet, while snow survey measurements show snowpack levels to be 65 % of the 30-year average.
